## LAB REPORT

on

## COURSE TITLE

*Submitted by*

**Nidhi M N (1BM21CS266)**

*in partial fulfillment for the award of the degree of*

**BACHELOR OF ENGINEERING**

*in*

**COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING**

(Autonomous Institution under VTU)

**BENGALURU-560019**

**October-2023 to Feb-2024**

**B. M. S. College of Engineering,**  
**Bull Temple Road, Bangalore 560019**  
(Affiliated To Visvesvaraya Technological University, Belgaum)  
**Department of Computer Science and Engineering**

**CERTIFICATE**

This is to certify that the Lab work entitled “Compiler Design” carried out by **Nidhi M N (1BM21CS266)**, who is bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2023. The Lab report has been approved as it satisfies the academic requirements in respect of a **Compiler Design course (21CS5PCCPD)** work prescribed for the said degree.

**Dr Prasad.G.R**

Professor  
Department of CSE  
BMSCE, Bengaluru

**Dr. Jyothi S Nayak**

Professor and Head  
Department of CSE  
BMSCE, Bengaluru

11		Use YACC to convert: Infix expression to Postfix expression.	
12		Use YACC to generate Syntax tree for a given expression	
13		Use YACC to generate 3-Address code for a given expression	
14		Use YACC to generate the 3-Address code which contains Arrays.	

## Experiment No :01

### Aim of the program

Write a program to design Lexical Analyzer in C/C++/Java/Python Language (to recognize any five keywords, identifiers, numbers, operators and punctuations)

### Program

```
def analyze_input(input_text):

    keywords = ["char", "float", "bool", "int", "for", "break", "continue"]

    punctuation = [".", "!", ";", "?"]

    operators = ["+", "-", "*", "/", "%", "="]

    keys, ids, nums, ops, punct = 0, 0, 0, 0, 0

    for i in input_text.split():

        if i in keywords:

            if keys < 5:

                print(f'{i} is a keyword!\n')

                keys += 1

        elif i in punctuation:

            if punct < 5:

                print(f'{i} is a punctuation!\n')

                punct += 1

        elif i in operators:

            if ops < 5:

                print(f'{i} is an operator!\n')

                ops += 1

        elif i.isnumeric():

            if nums < 5:

                print(f'{i} is a number!\n')
```

```
    nums += 1
else:
    if ids < 5:
        flag = False
        if i[0].isalpha() or i[0] == '_':
            flag = True
        for j in i[1:]:
            if j in operators or j in punctuation:
                print(f'{i} is an invalid token!\n')
                flag = False
                break
        if flag:
            print(f'{i} is an identifier!\n')
            ids += 1
    else:
        print(f'{i} is an invalid token!\n')
```

```
while True:
    user_input = input("Enter your input! Enter blank next line to end: ")
    if not user_input.strip():
        break
    analyze_input(user_input)
```

### Output – Screen shot

```
Enter your input! Enter blank next line to end: char a123 5 , +  
char is a keyword!
```

```
a123 is an identifier!
```

```
5 is a number!
```

```
, is an invalid token!
```

```
+ is an operator!
```

```
Enter your input! Enter blank next line to end:
```

## Experiment No :02

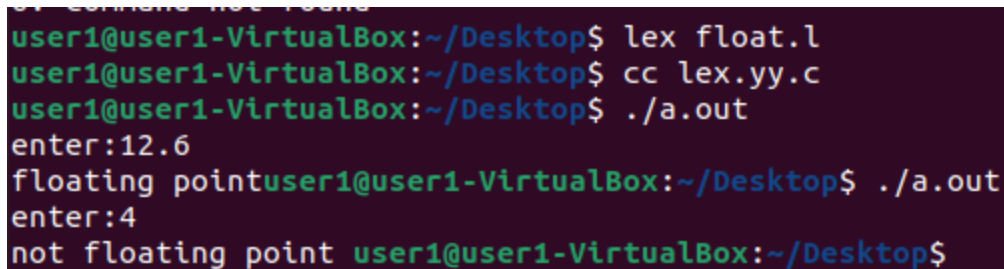

### Aim of the program

Write a program in LEX to recognize Floating Point Numbers.

### Program

```
%{
#include<stdio.h>
int flag=0;
%}
alpha[a-zA-Z]
digit[0-9]
decimal[.]
%%
[+|-]?({digit})*({decimal})({digit})* { flag=1;}
{alpha}({alpha})({digit})* {printf("invalid number ");}
\n return 0;
%%
int yywrap(){
int main(){
printf("enter :");
yylex();
if(flag==1){ printf("floating point number");}
else{printf(" not a floating point number");}
}
}
```

### Output – Screen shot

```
user1@user1-VirtualBox:~/Desktop$ lex float.l
user1@user1-VirtualBox:~/Desktop$ cc lex.yy.c
user1@user1-VirtualBox:~/Desktop$ ./a.out
enter:12.6
floating pointuser1@user1-VirtualBox:~/Desktop$ ./a.out
enter:4
not floating point user1@user1-VirtualBox:~/Desktop$
```

## Experiment No :03

### Aim of the program

**Write a program in LEX to recognize different tokens: Keywords, Identifiers, Constants, Operators**

**and Punctuation symbols.**

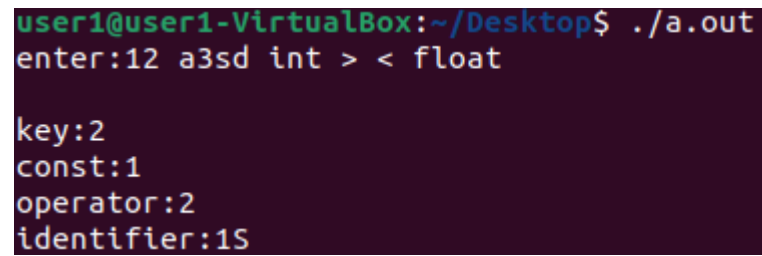

### Program

```
% {  
#include<stdio.h>  
int x1=0,x2=0,x3=0,x4=0;  
% }  
alpha[a-zA-Z]  
digit[0-9]  
d[.]  
%%  
int|float|char { x1++;}  
{ digit}+ { x2++;}  
[<|>|=|<=|>|=|=] { x3++;}  
{ alpha}({ digit}|{ alpha})* { x4++;}  
\n {  
printf("\nkey:%d",x1);  
printf("\nconst:%d",x2);  
printf("\noperator:%d",x3);  
printf("\nidentifier:%d",x4);  
}  
%%  
int yywrap(){ }  
int main(){  
printf("enter:");
```

```
yylex();  
}
```

#### Output – Screen shot

A terminal window with a dark purple background. The prompt is 'user1@user1-VirtualBox:~/Desktop\$'. The command './a.out' has been executed. The input 'enter:12 a3sd int > < float' has been entered. The output shows four lines: 'key:2', 'const:1', 'operator:2', and 'identifier:15'.

```
user1@user1-VirtualBox:~/Desktop$ ./a.out  
enter:12 a3sd int > < float  
  
key:2  
const:1  
operator:2  
identifier:15
```

## Experiment No :04

### Aim of the program

**Write a LEX program that copies a file, replacing each nonempty sequence of white spaces by a single blank.**

### Program

```
% {  
#include<stdio.h>  
% }  
%%  
  
[ ]([ ])* {fprintf(yyout," ");}  
([ ])*(\n)([ ])* {fprintf(yyout," ");}  
%%  
  
int yywrap(){}  
int main(){  
printf("running");  
yyin=fopen("txt","r");  
yyout=fopen("txto","w");  
yylex();  
}
```

### Output – Screen shot

```
1 hi friend happy new year welcome to 2024 .
```

## Experiment No :05

### Aim of the program

Write a LEX program to recognize the following tokens over the alphabets {0,1,...,9}

- a) The set of all string ending in 00.
- b) The set of all strings with three consecutive 222's.
- c) The set of all string such that every block of five consecutive symbols contains at least two 5's.
- d) The set of all strings beginning with a 1 which, interpreted as the binary representation of an integer, is congruent to zero modulo 5.
- e) The set of all strings such that the 10th symbol from the right end is 1.
- f) The set of all four digits numbers whose sum is 9
- g) The set of all four digital numbers, whose individual digits are in ascending order from left to right.

### Program

```
% {  
#include<stdio.h>  
int x1=0,x2=0,x3=0,x4=0;  
% }  
alpha[a-zA-Z]  
digit[0-9]  
d[.]  
%%  
({digit})*00 {printf("\n%s rule A",yytext);}   
({digit})*222({digit})* {printf("\n%s rule B",yytext);}   
(1(0)*(11|01)(01*01|00*10(0)*(11|1))*0)(1|10(0)*(11|01)(01*01|00*10(0)*(11|1))*10)*  
{printf("\n%s rule D",yytext);}   
({digit})*1{digit}{9} {printf("\n%s rule E",yytext);}   
{digit}{4} {  
int sum=0;  
for(int i=0;i<4;i++){
```

```

sum=sum+yytext[i]-48;
}
if(sum==9) {printf("\n%s rule F",yytext);}
sum=1;
for(int j=0;j<3;j++){
if(yytext[j]>yytext[j+1]) sum=0;
}
if(sum==1) {printf("\n%s rule G",yytext);}

}

{d}* {int i=0; int c=0;
if(yyleng<5) {break;}
for(i=0;i<5;i++) {
if(yytext[i]=='5') c++;

}
if(c<2) {break;}

else{

for(;i<yyleng;i++){
if(yytext[i-5]=='5') c--;
if(yytext[i]=='5') c++;
if(c<2) break;

}
if(i==yyleng) {printf("\n %s rule C",yytext);}

```

```
}
```

```
}
```

```
%%
```

```
int yywrap(){}
```

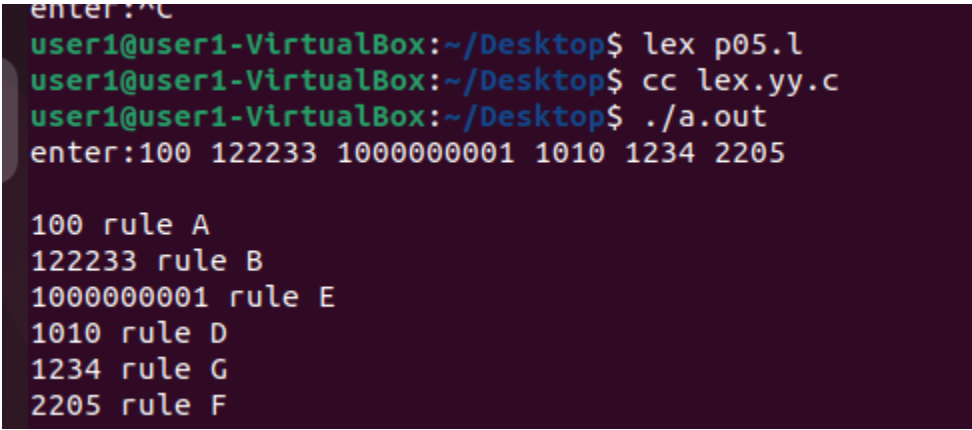

```
int main(){
```

```
printf("enter:");
```

```
yylex();
```

```
}
```

### Output – Screen shot

```
enter: ^C
user1@user1-VirtualBox:~/Desktop$ lex p05.l
user1@user1-VirtualBox:~/Desktop$ cc lex.yy.c
user1@user1-VirtualBox:~/Desktop$ ./a.out
enter:100 122233 1000000001 1010 1234 2205

100 rule A
122233 rule B
1000000001 rule E
1010 rule D
1234 rule G
2205 rule F
```

## Part-B:

Experiment No :01

**Aim of the program**

**1. Write a program to implement**

**(a) Recursive Descent Parsing with back tracking (Brute Force Method).  $S \rightarrow cAd$ ,  $A \rightarrow ab/a$**

**(b) Recursive Descent Parsing with back tracking (Brute Force Method).  $S \rightarrow cAd$ ,  $A \rightarrow a/ab$**

### Program

```
#include<stdio.h>
#include<conio.h>
#include<string.h>
int A();
char str[15];
int isave,curr_ptr=0;
int main(void)
{
    clrscr();
    printf("1.S->cAd\n2.A->ab/a\n");
    printf("this is parser for the above grammar:\n");
    printf("Enter any string:");
    scanf("%s",str);
    while(curr_ptr<strlen(str))
    {
        //S has only one immediate derivation which is cAd
        //match with c
        if (str[curr_ptr]=='c')
        {
            curr_ptr++;
            //call function to match A
            if (A()) //checking the productions of A->ab/a
            {
                curr_ptr++;
                //match d
                if (str[curr_ptr]=='d' && str[curr_ptr+1]=='\0')
                {
                    //success
                    printf("string is accepted by the grammar");
                    getch();
                    return 1;
                }
            }
            else break;
```

```

}
else break;
}
else break;
}
//incase any of them fail to match return negatively.
printf("string is not accepted by the grammar");
//getch();
return 0;
}
int A() //sub function A()
{
isave=curr_ptr;

if (str[curr_ptr]=='a')
{
curr_ptr++;
if(str[curr_ptr]=='b')
return 1;
}
curr_ptr=isave; //return to start
//check if a is matched and return accordingly.
if(str[curr_ptr]=='a')
return 1;
else
return 0;
}

```

## Output – Screen shot

```
1.S->cAd
2.A->ab/a
this is parser for the above grammar:
Enter any string:cdd
string is not accepted by the grammar
```

```
1.S->cAd
2.A->ab/a
this is parser for the above grammar:
Enter any string:cabd
string is accepted by the grammar
```

# Part-C:

```

## Experiment No :06

### Aim of the program

Use YACC to generate 3-Address code for a given expression

### Program

**p.y**

```
%{  
#include <math.h>  
#include <ctype.h>  
#include <stdio.h>  
int var_cnt=0;  
char iden[20];  
%}  
%token digit  
%token id  
%%  
  
S:id '=' E { printf("%s = t%d\n",iden, var_cnt-1); }  
E:E '+' T { $$=var_cnt; var_cnt++; printf("t%d = t%d + t%d;\n", $$, $1, $3 );  
}  
E:E '-' T { $$=var_cnt; var_cnt++; printf("t%d = t%d - t%d;\n", $$, $1, $3 );  
}  
T { $$=$1; }  
;  
T:T '*' F { $$=var_cnt; var_cnt++; printf("t%d = t%d * t%d;\n", $$, $1, $3 ); }  
T:T '/' F { $$=var_cnt; var_cnt++; printf("t%d = t%d / t%d;\n", $$, $1, $3 ); }  
F { $$=$1 ; }  
;
```

```

F:P '^' F { $$=var_cnt; var_cnt++; printf("t%d = t%d ^ t%d;\n", $$, $1, $3 );}
| P { $$ = $1;}
;

```

```

P: '(' E ')' { $$=$2; }
|digit { $$=var_cnt; var_cnt++; printf("t%d = %d;\n",$$,$1); }
